Search Problems

agent

entity that perceives its environment
and acts upon that environment

state

a configuration of the agent and
its environment

initial state

the state in which the agent begins

initial state

2	4	5	7
8	3	1	11
14	6		10
9	13	15	12

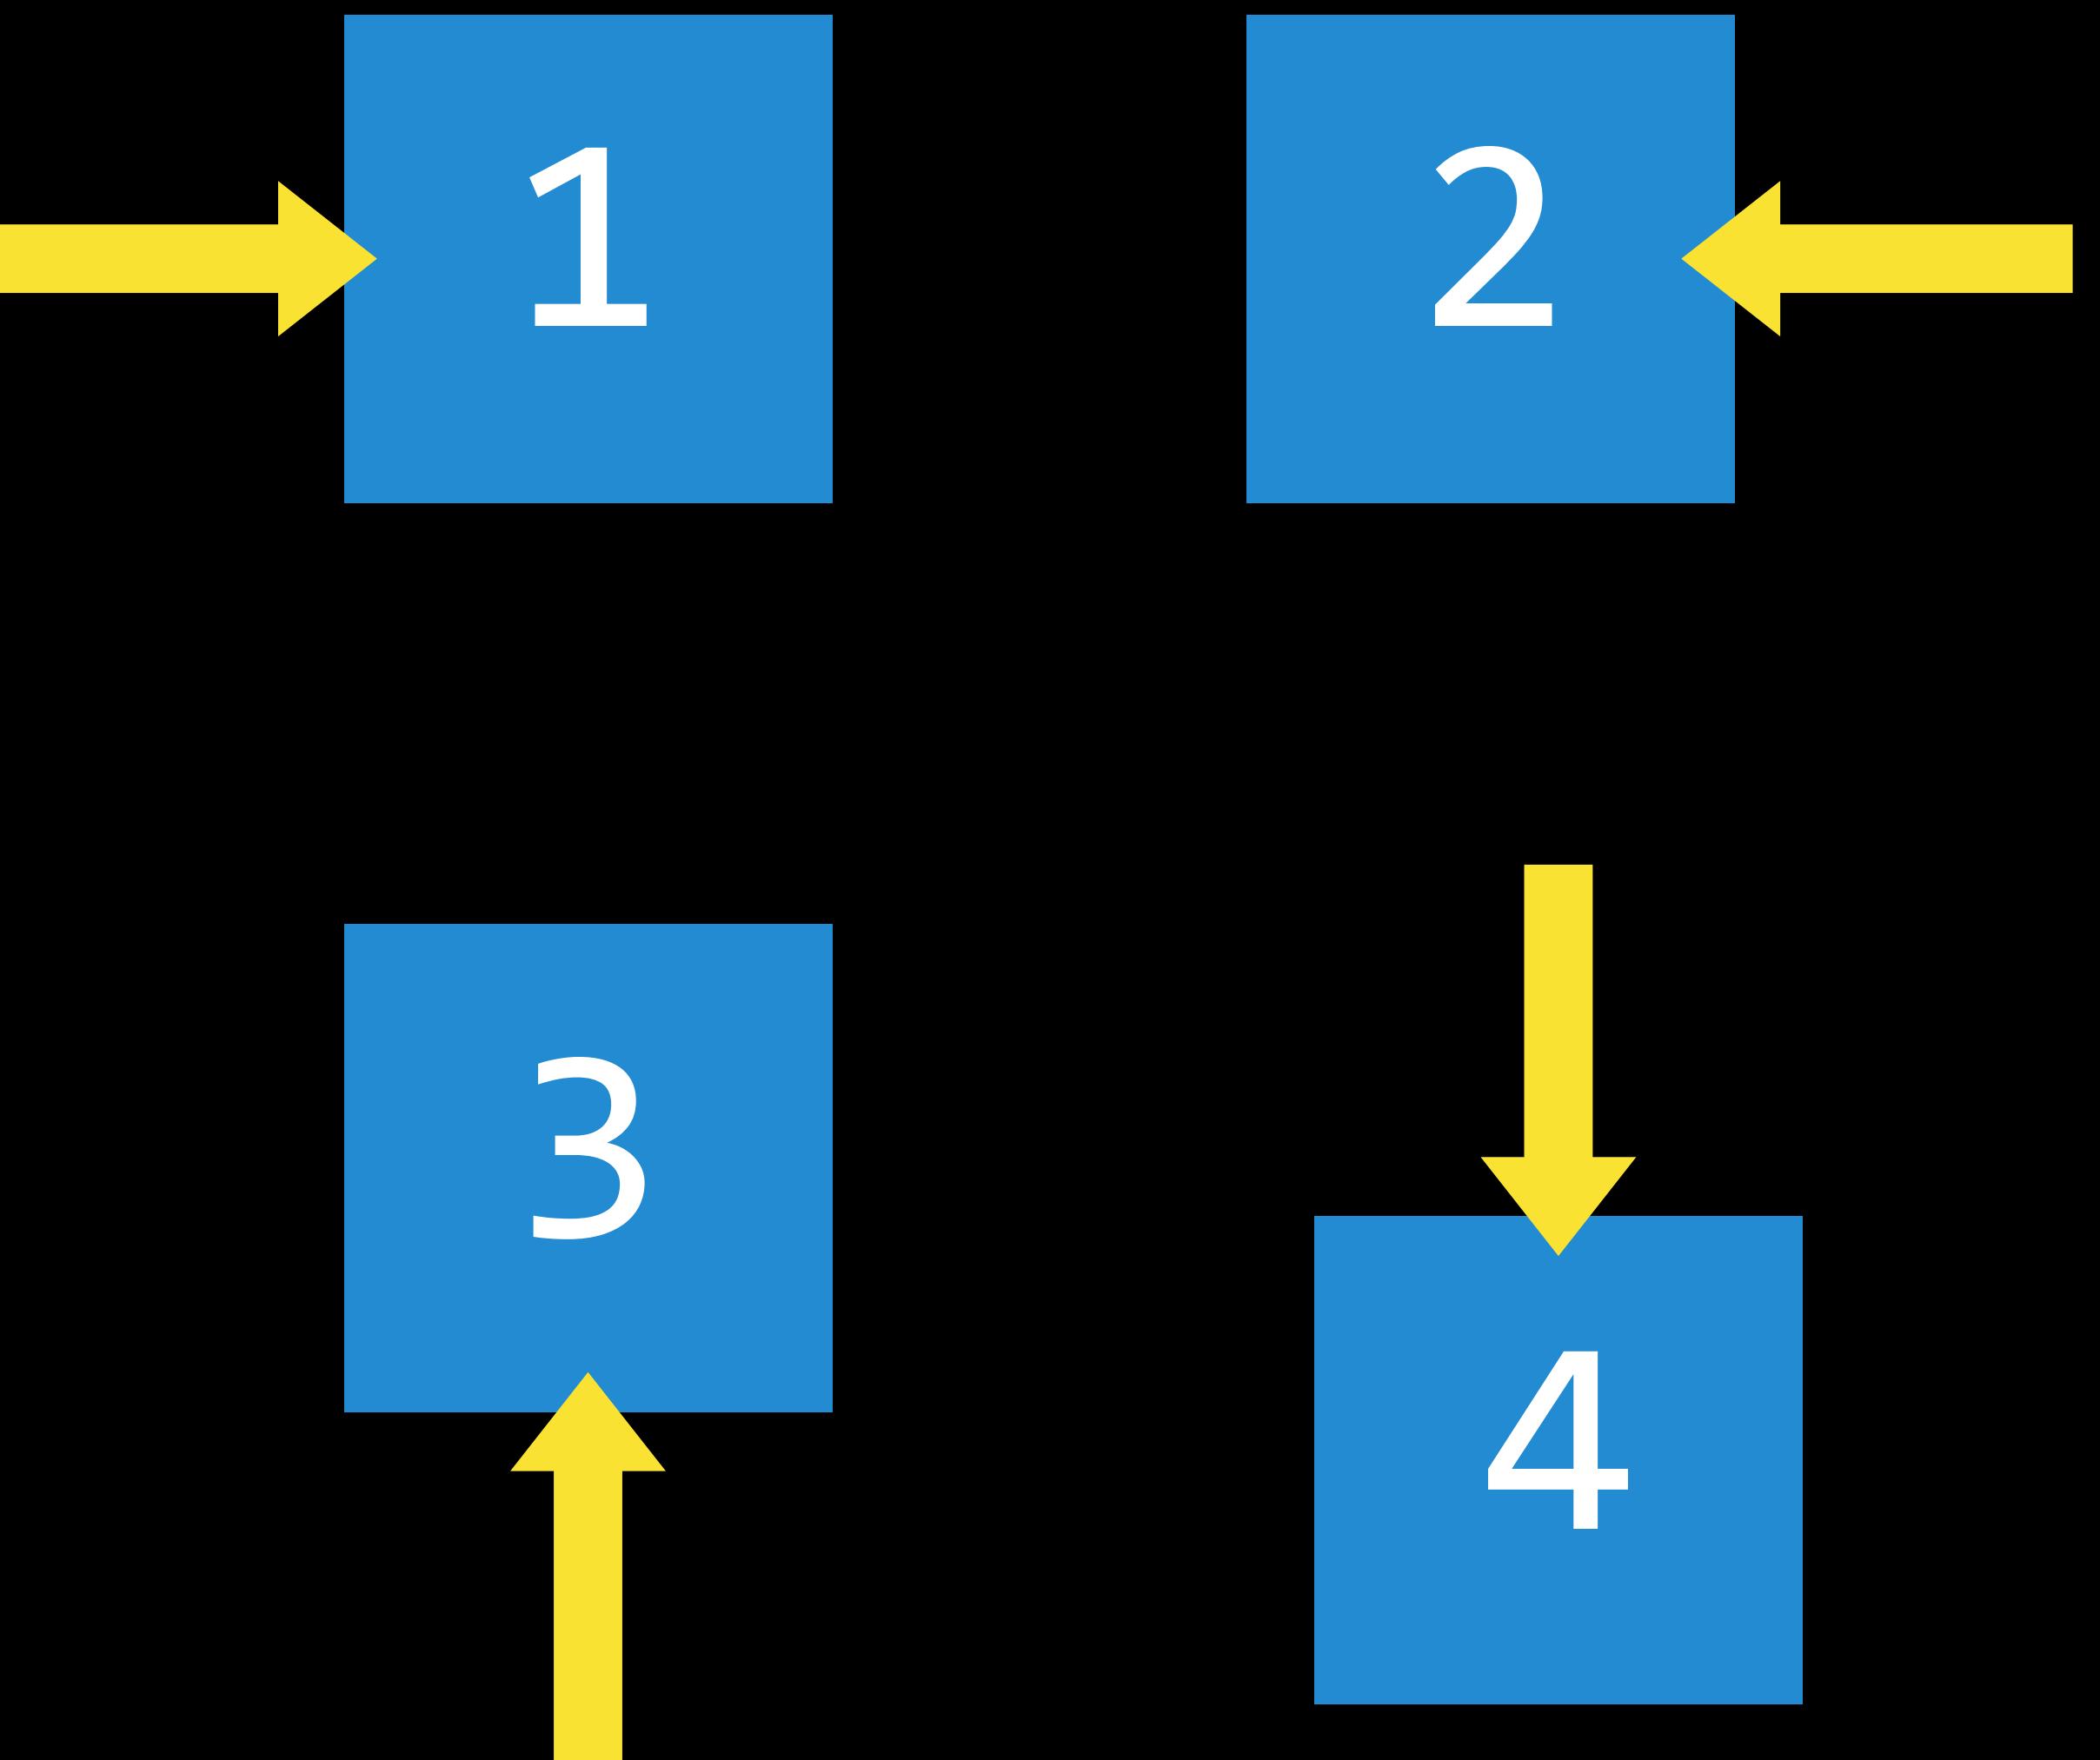

actions

choices that can be made in a state

actions

$\text{ACTIONS}(s)$ returns the set of actions that can be executed in state s

actions

transition model

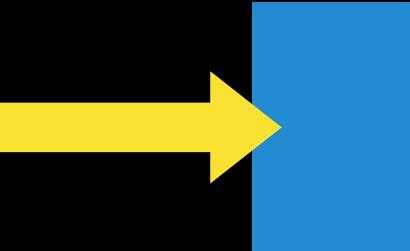

a description of what state results from performing any applicable action in any state

transition model

$\text{RESULT}(s, a)$ returns the state resulting from performing action a in state s

state space

the set of all states reachable from the initial state by any sequence of actions

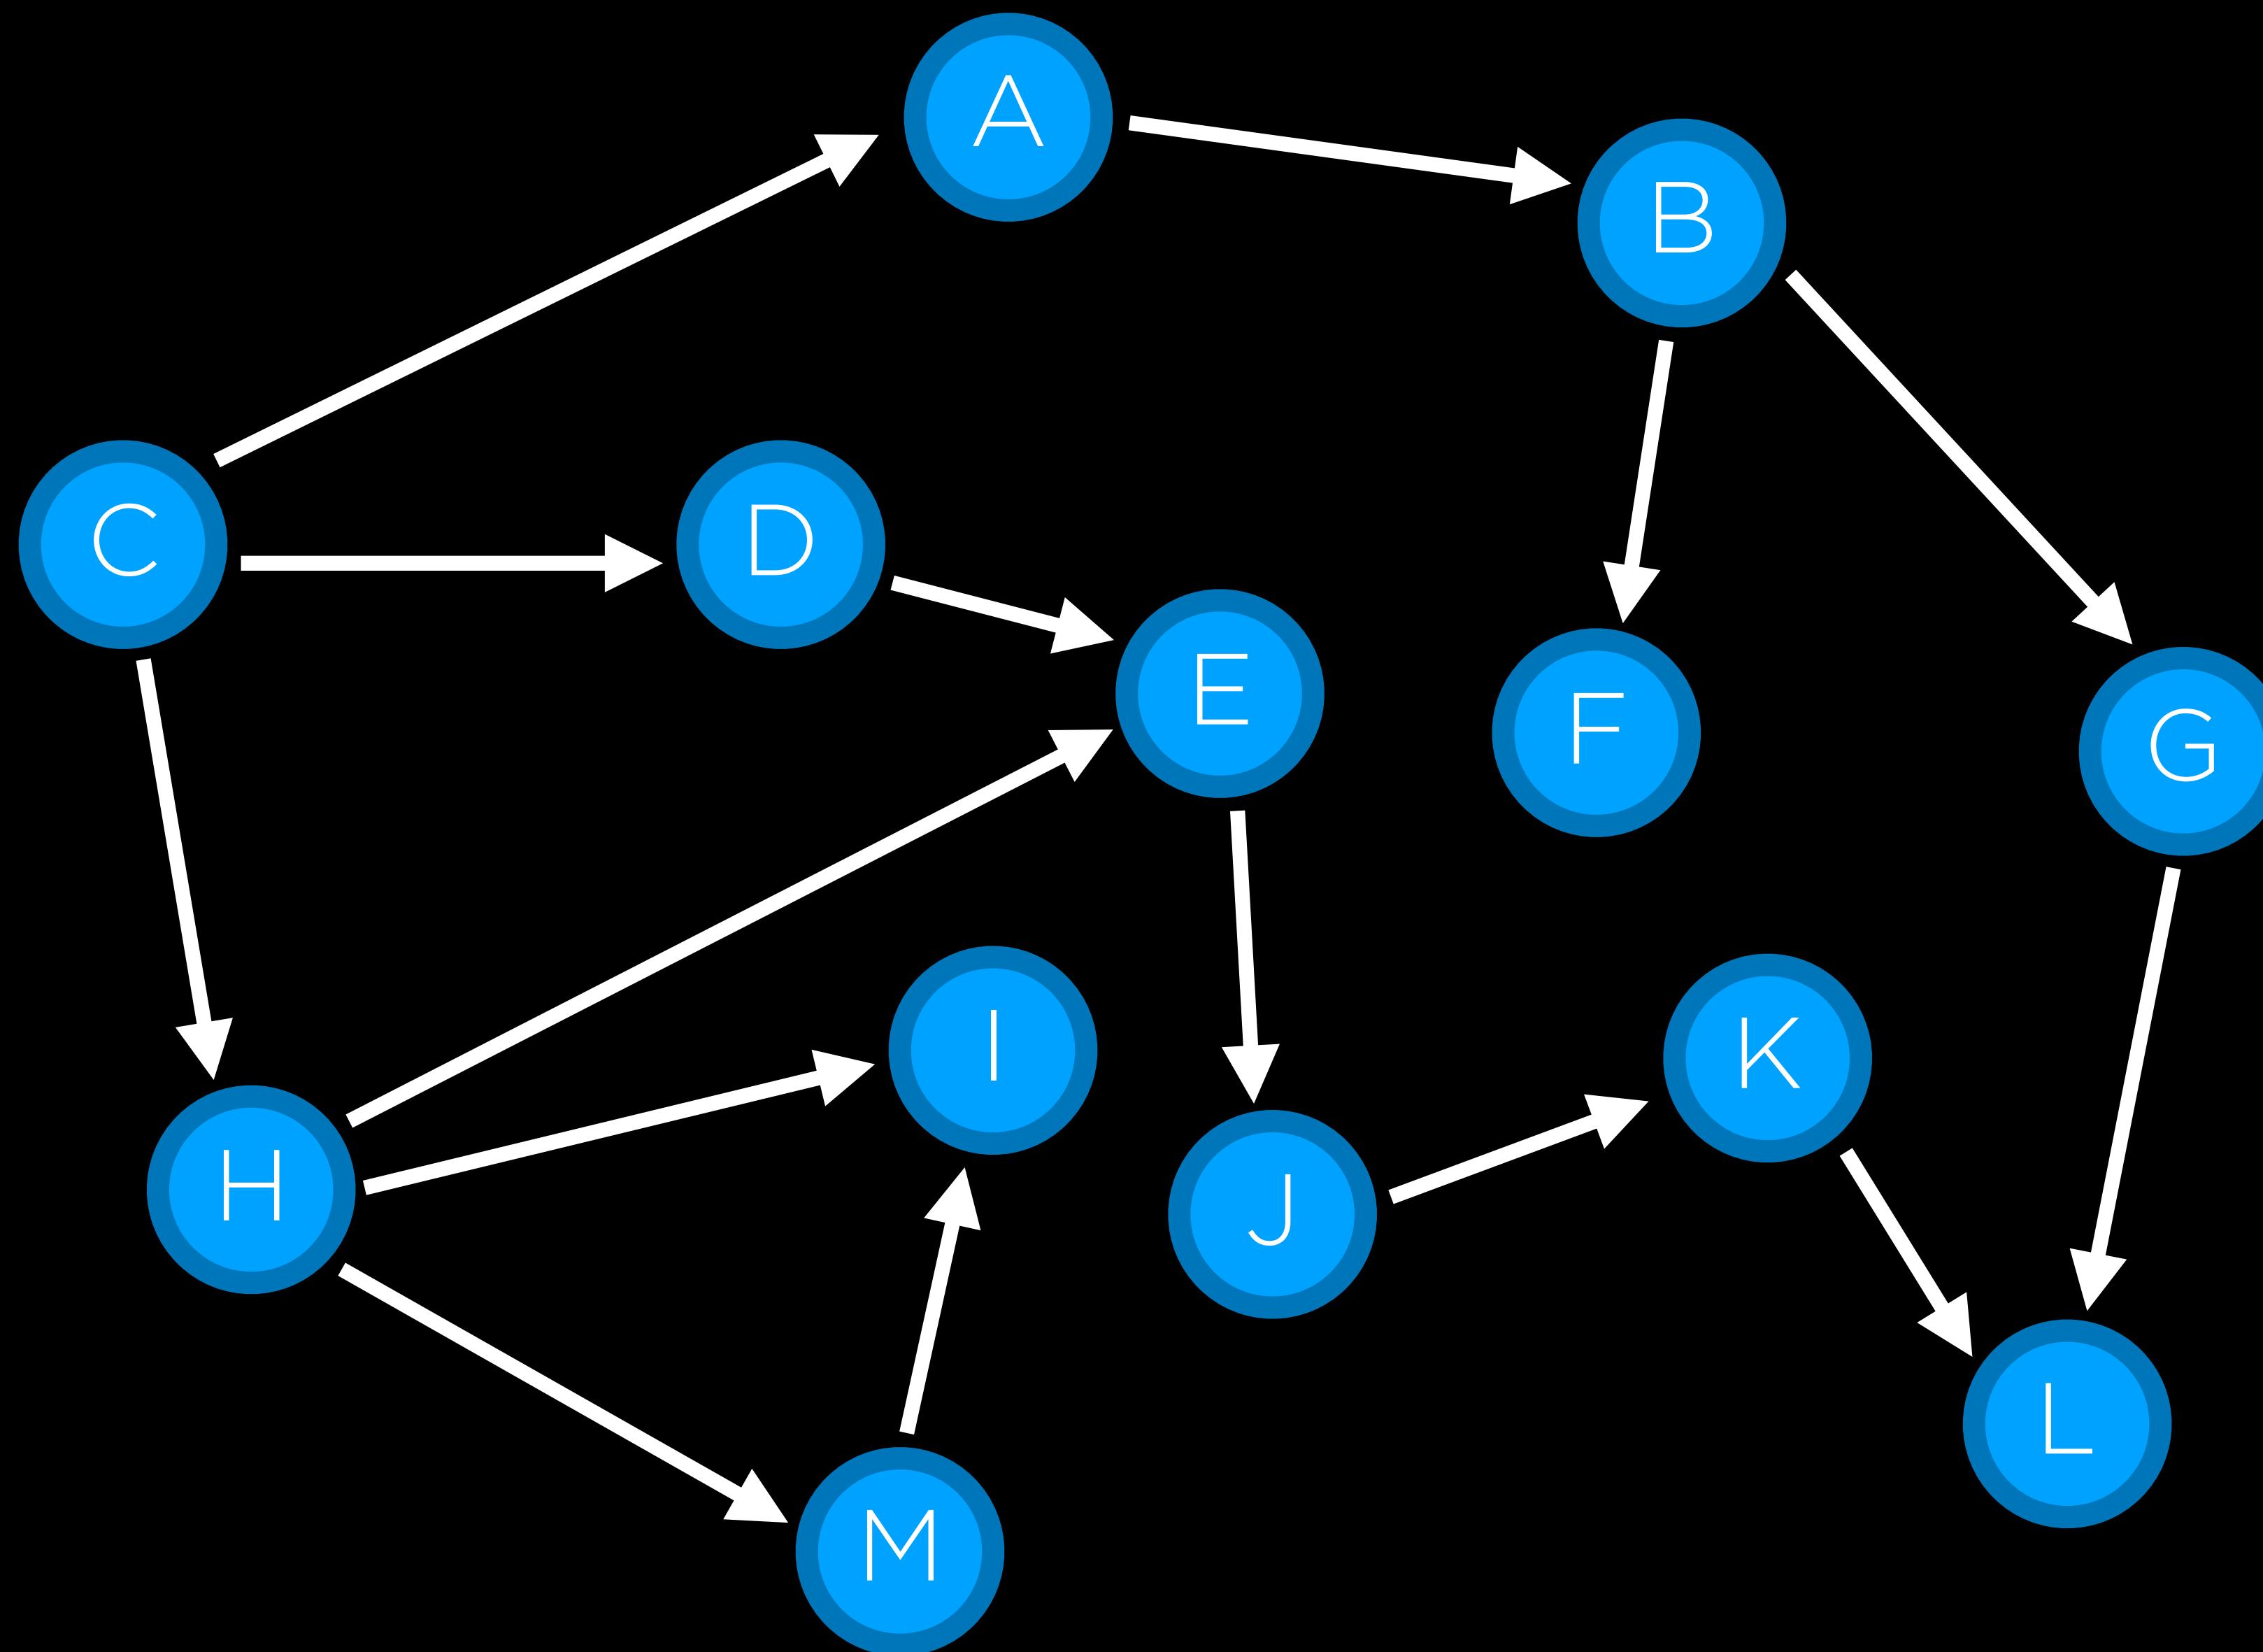

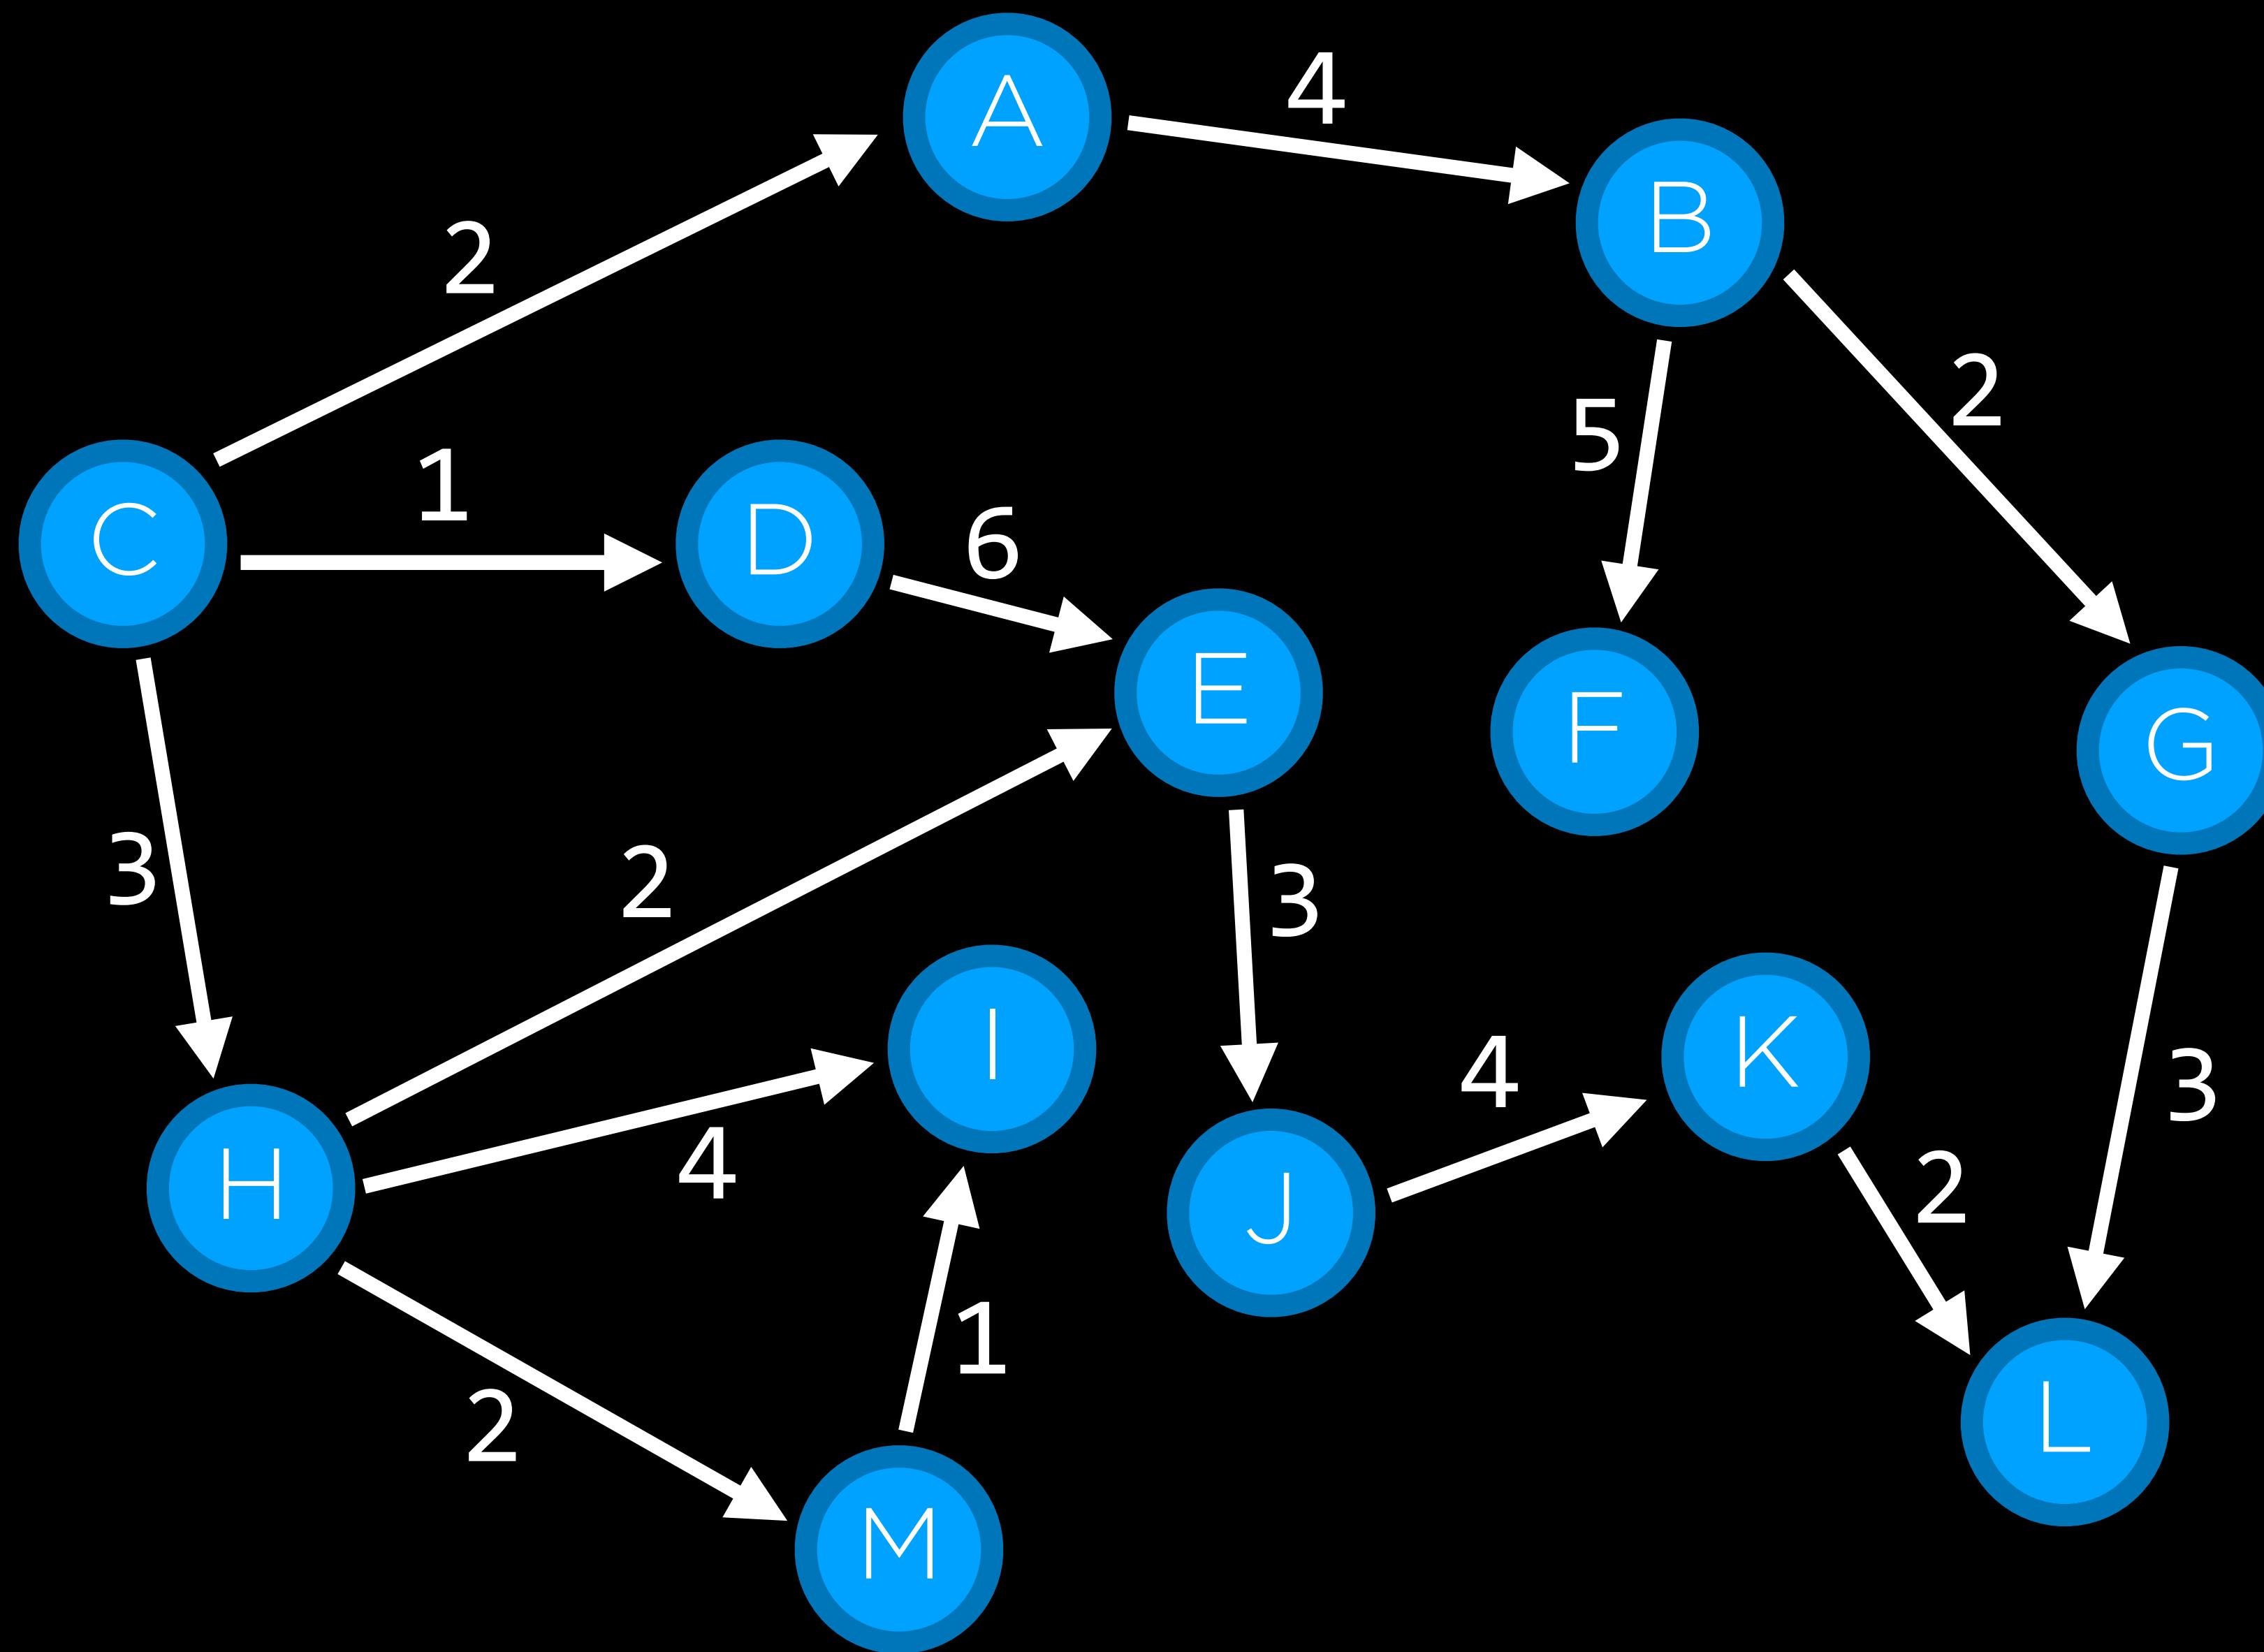

goal test

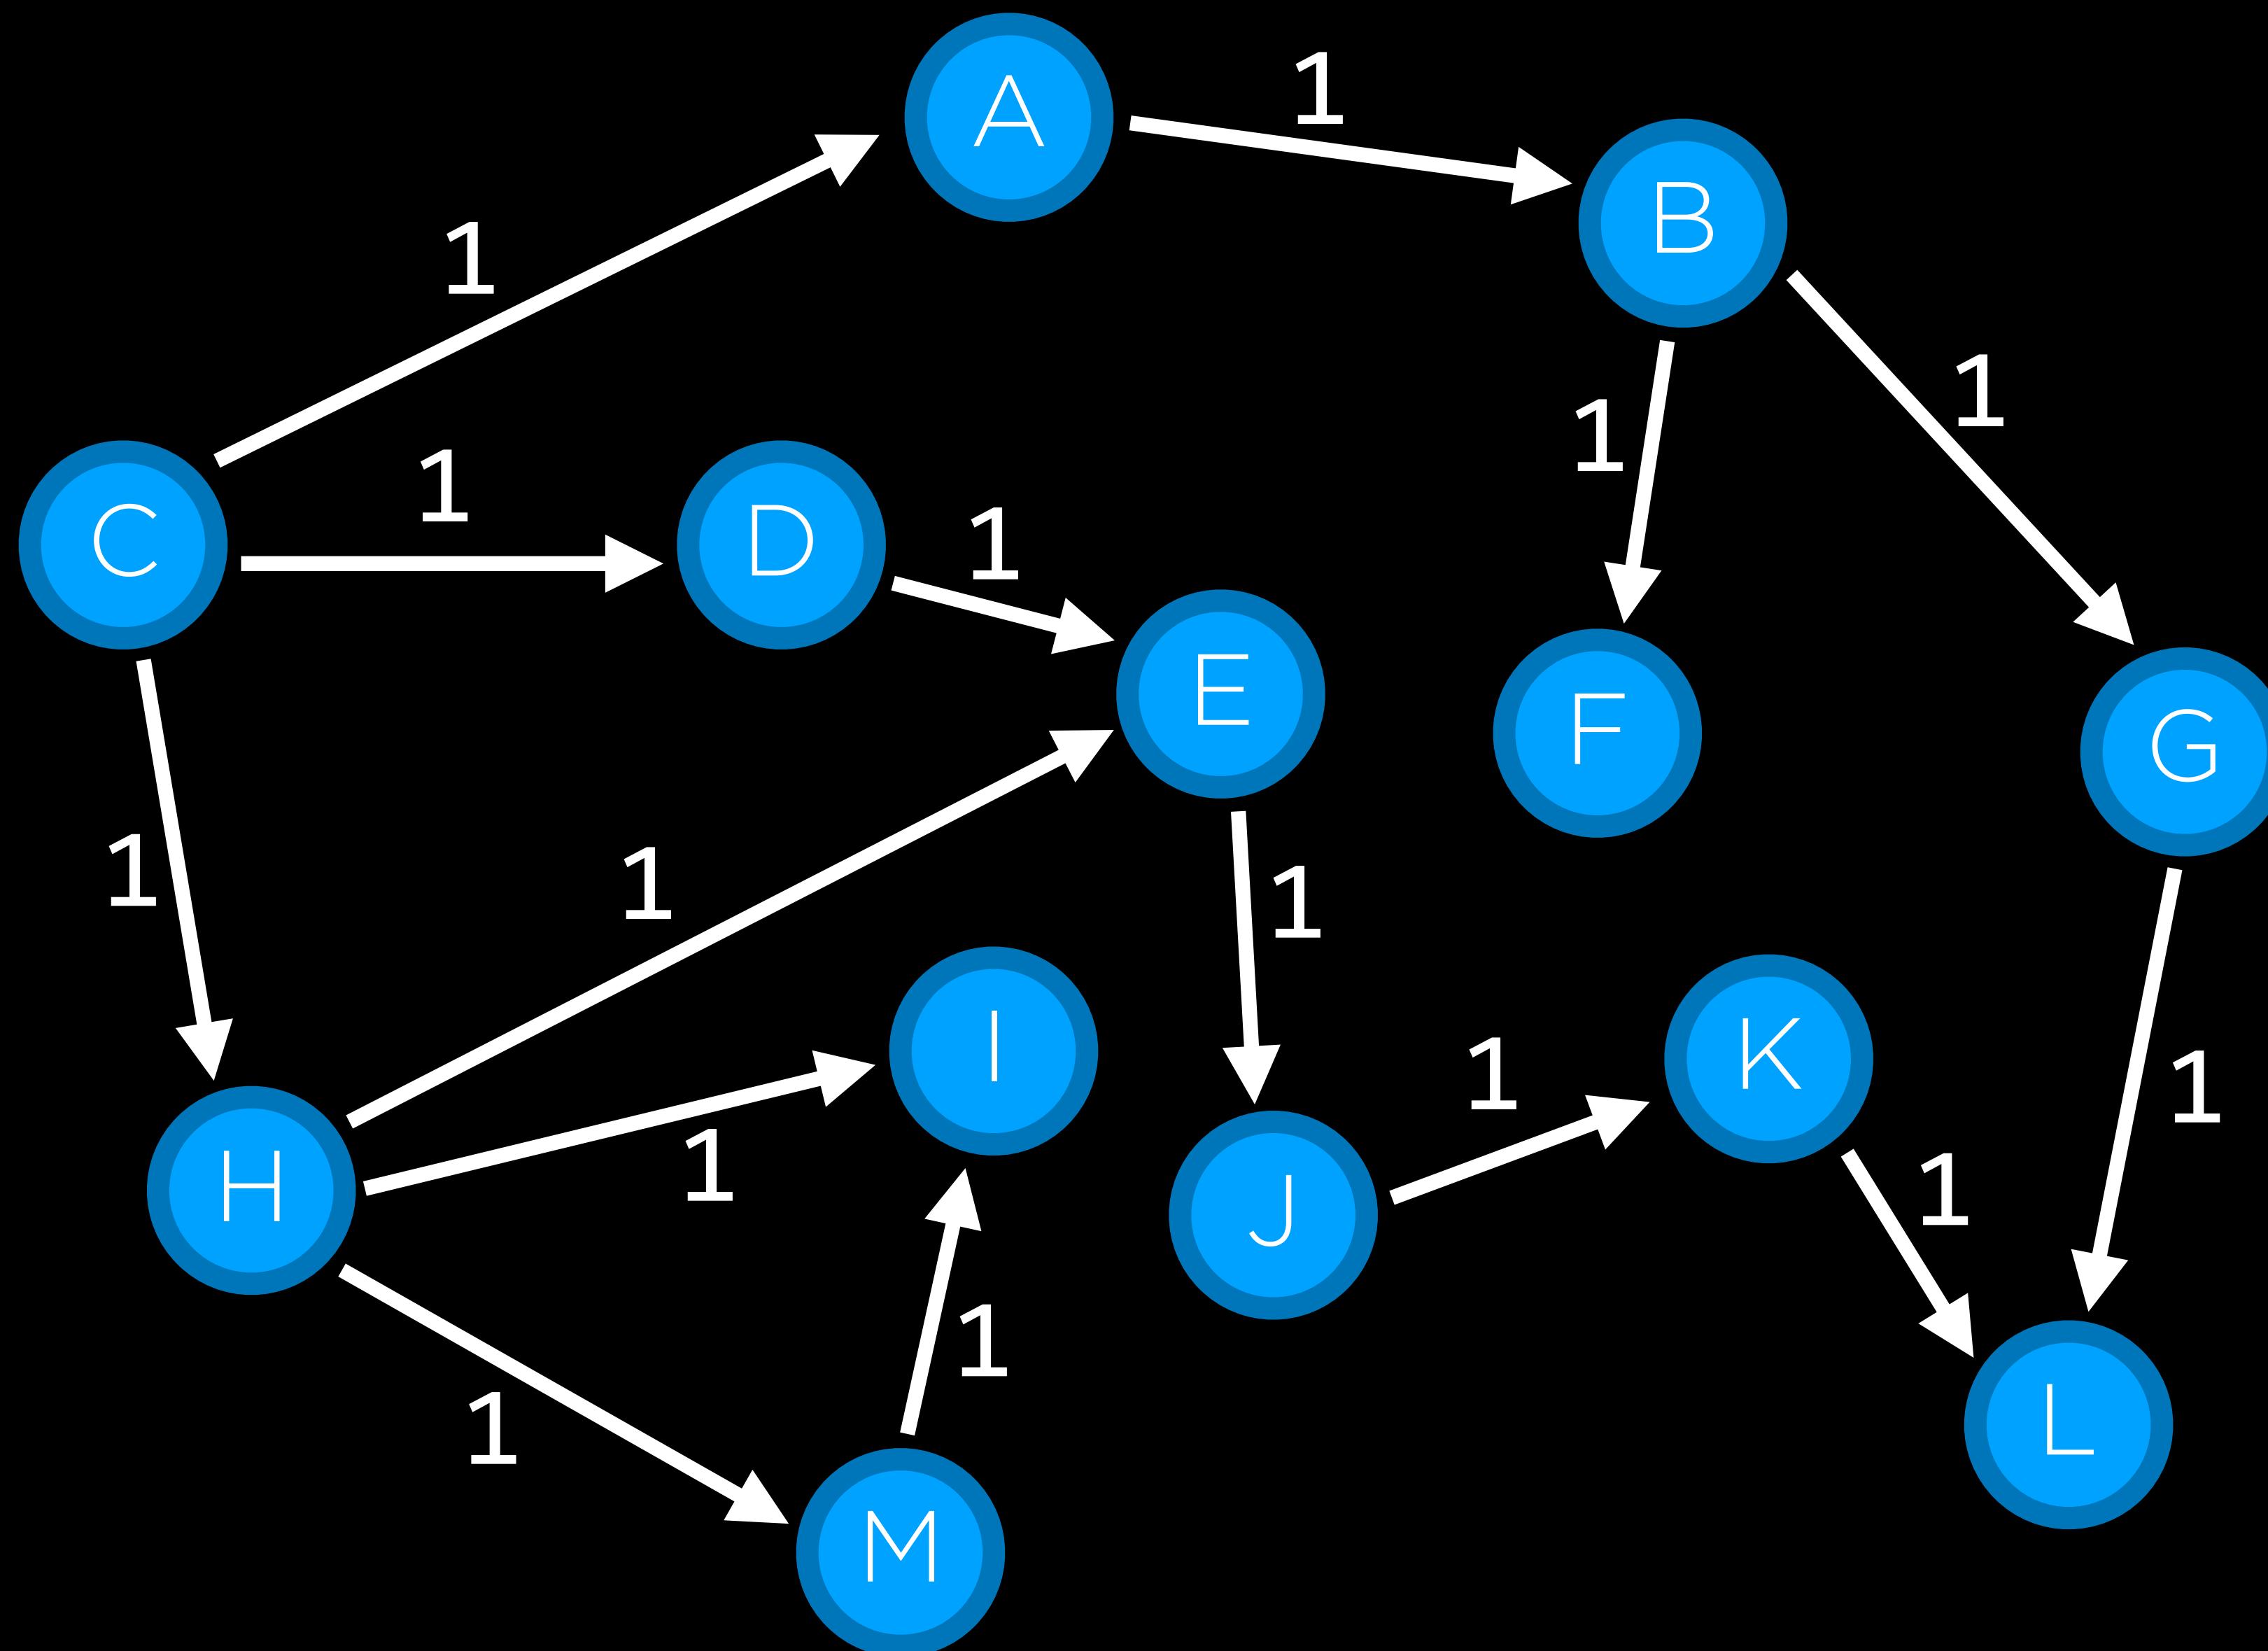

way to determine whether a given state
is a goal state

path cost

numerical cost associated with a given path

Search Problems

- initial state
- actions
- transition model
- goal test
- path cost function

solution

a sequence of actions that leads from the initial state to a goal state

optimal solution

a solution that has the lowest path cost
among all solutions

node

a data structure that keeps track of

- a **state**
- a **parent** (node that generated this node)
- an **action** (action applied to parent to get node)
- a **path cost** (from initial state to node)

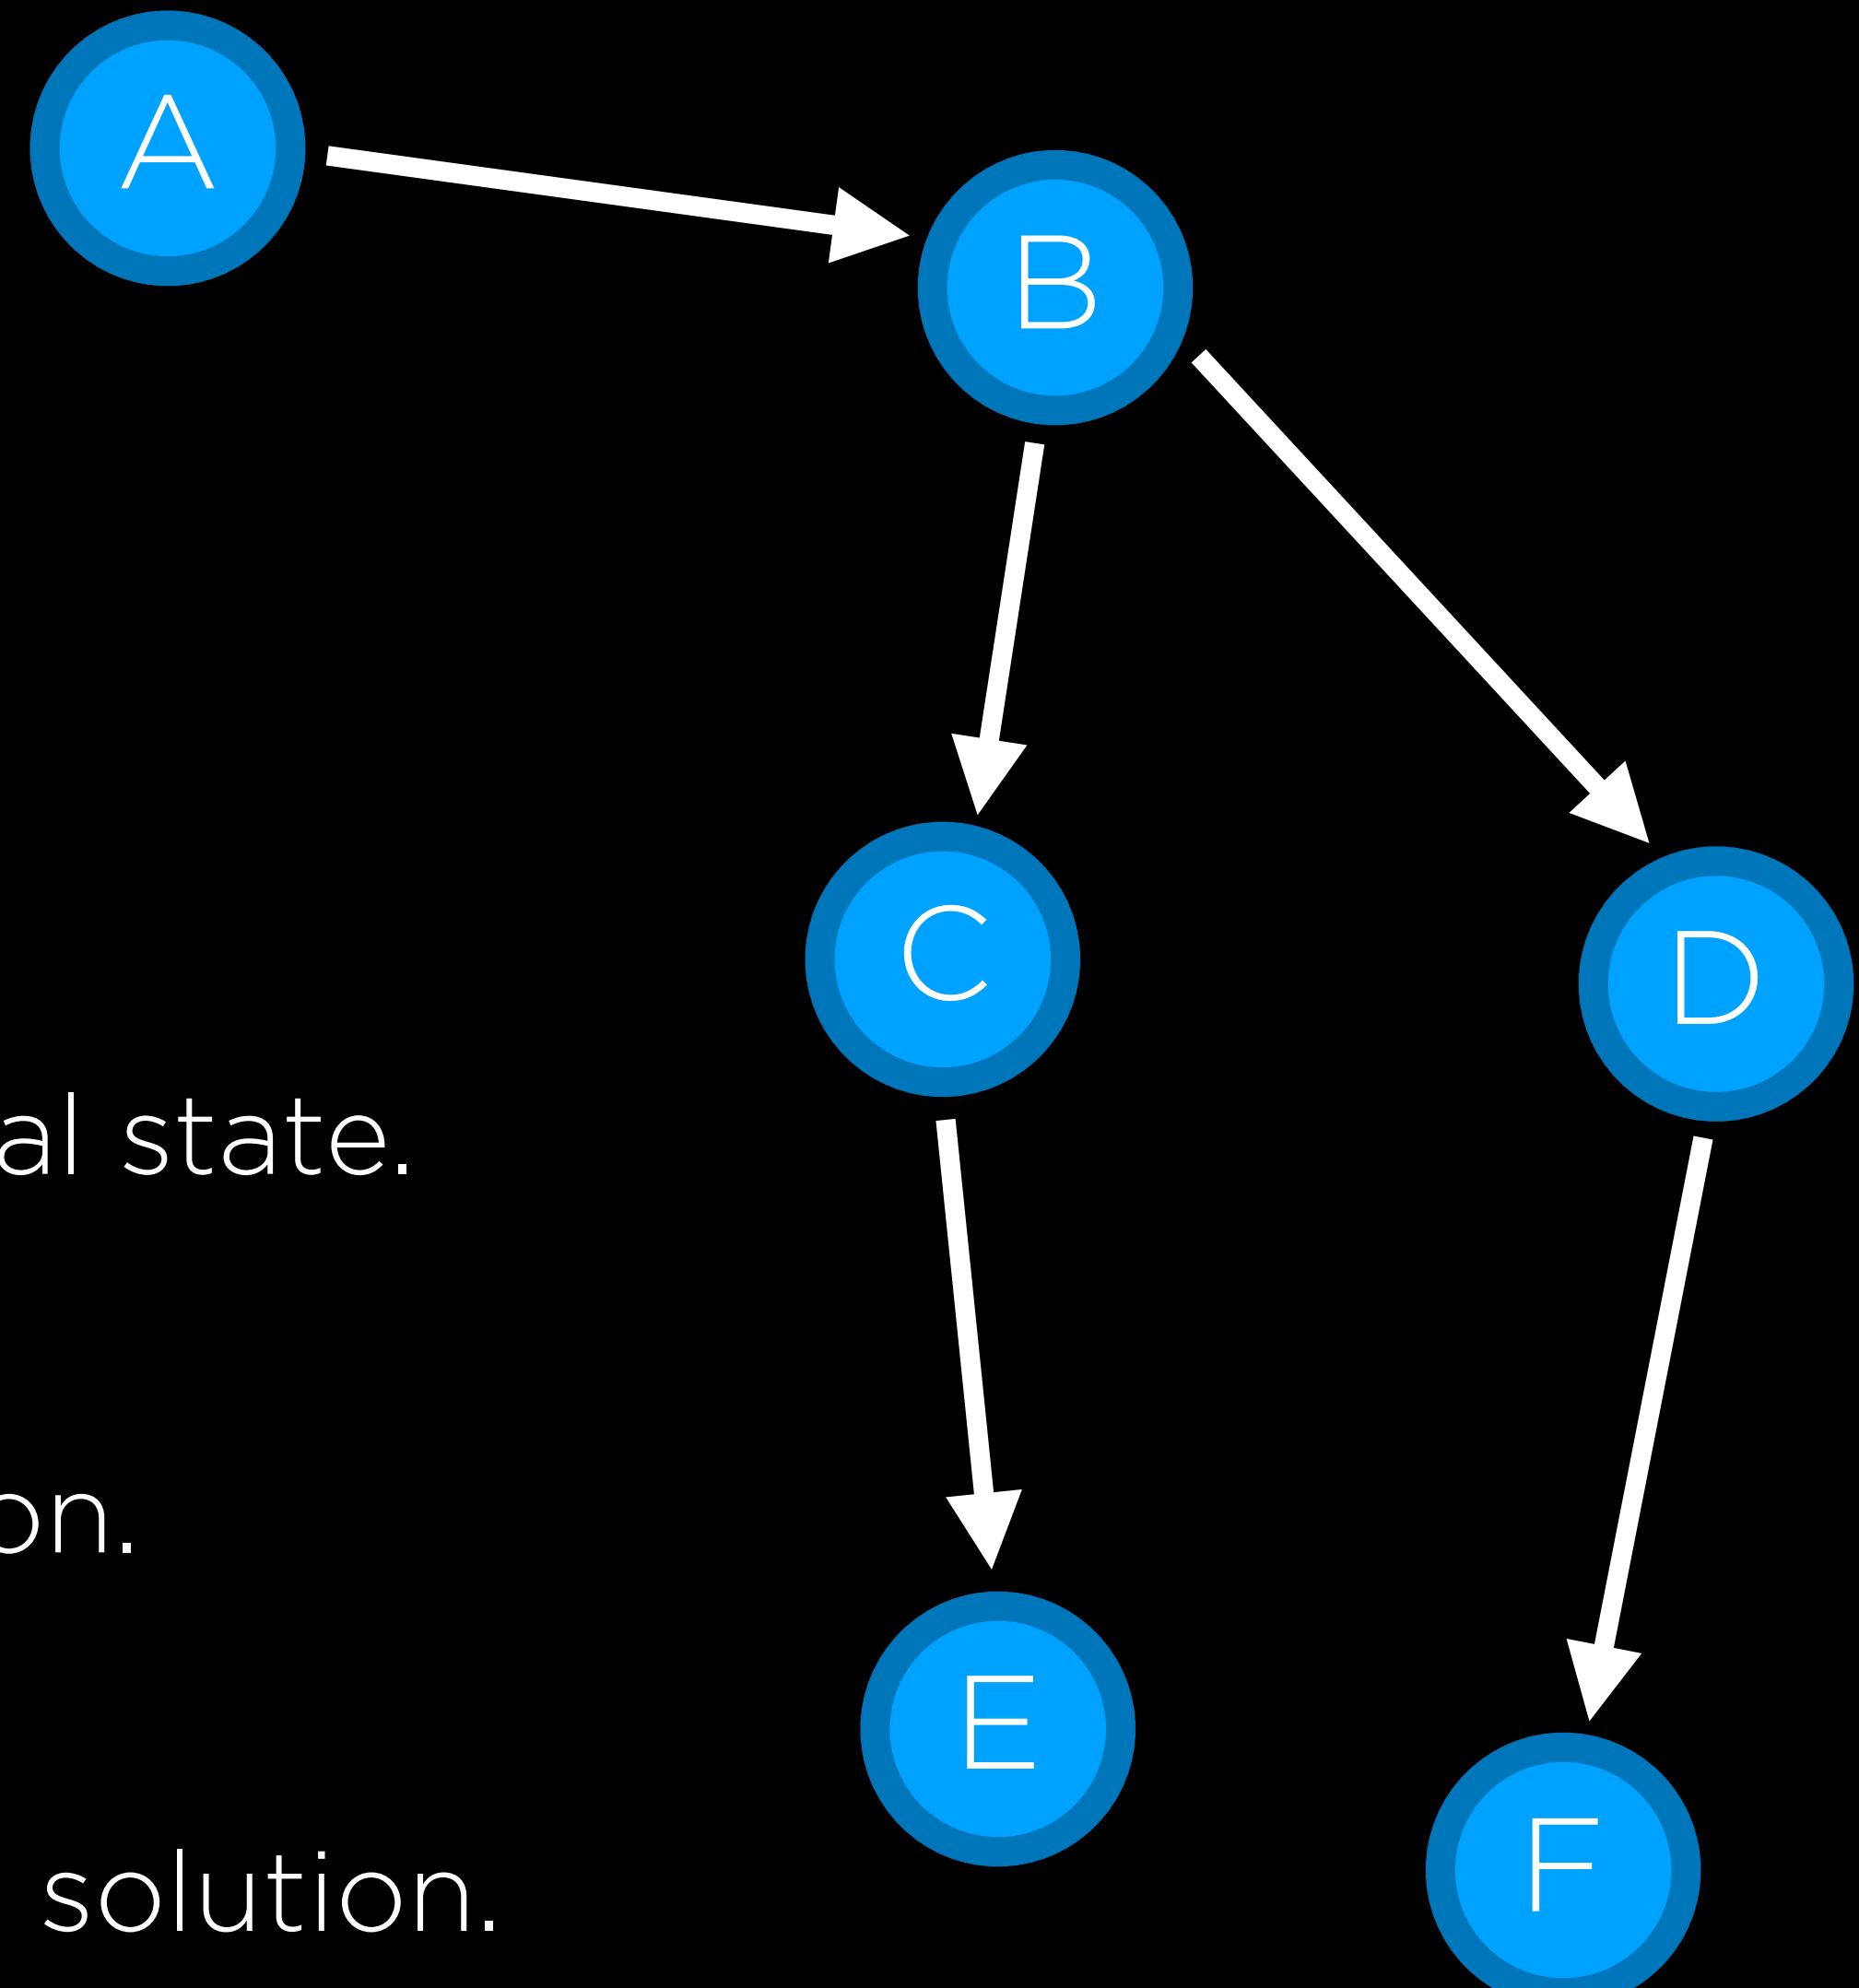

Approach

- Start with a **frontier** that contains the initial state.
- Repeat:
 - If the frontier is empty, then no solution.
 - Remove a node from the frontier.
 - If node contains goal state, return the solution.
 - **Expand** node, add resulting nodes to the frontier.
